

SPECIFICATION

Page 12 Paragraph 0057

Referring to Figures 2 and 3, the insertion tools **20** and **30**, in one embodiment of the invention, have an elongated shaft including a handle **21** and **31** at one end and at an opposing end a receptacle **22** and **32** which conforms to and supports the junction of the prosthesis cylinder and connection with the tubing. A notch of similar diameter with the tubing is utilized as a receptacle. At its widest cross-section, the receptacle has a dimension of approximately one centimeter. The receptacle has a smooth peripheral edge and finish which guards against damage to penile tissue and the prosthesis device in the surgical placement of the prosthesis. The insertion tools **20** and **30** have the further advantage of not having sharp angles, which get entangled with the sutures during corporotomy closure.
